

Supplementary Figure 2: Bar diagram showing a 30 U/mL cut-off value for anti-C1q antibody titer being used to predict cases with an activity index >10 on kidney biopsy. Out of 18 patients with an anti-C1q antibody titer ≥ 30 U/mL, 11 had an activity index >10 on kidney biopsy, while out of the 32 patients with a low anti-C1q titer <30 U/mL, only 7 had an activity index >10 on kidney biopsy.
